Marketplace

DRUG NAME	Elevidys (delandistrogene moxeparvovec-rokl)
BENEFIT TYPE	Medical
STATUS	Prior Authorization Required

Elevidys is an adeno-associated virus vector-based gene therapy indicated for the treatment of ambulatory pediatric patients aged 4 through 5 years with Duchenne muscular dystrophy (DMD) with a confirmed mutation in the DMD gene. It is the first recombinant gene therapy product marketed for DMD.

DMD is a rare and lethal X-linked recessive neuromuscular disorder caused by mutations in the dystrophin gene that result in absent or insufficient functional dystrophin, a cytoskeletal protein that enables the strength, stability, and functionality of myofibres. Progressive muscular damage and degeneration occurs in people with DMD, resulting in muscular weakness, associated motor delays, loss of ambulation, respiratory impairment, and cardiomyopathy.

Elevidys was approved under accelerated approval based on expression of Elevidys microdystrophin in skeletal muscles. Continued approval is contingent upon further confirmatory trial(s). Efficacy was assessed in a phase 2 trial in which the primary endpoint was not found to be significant (change in NSAA total score from baseline to Week 48). Confirmatory trials are pending.

Elevidys (delandistrogene moxeparvovec-rokl) will be considered for coverage when the following criteria are met:

Duchenne muscular dystrophy (DMD)

For **initial** authorization:

1. Member is a male; AND
2. Member is 4 to 5 years of age; AND
3. Medication is being prescribed by or in consultation with a DMD specialist (i.e., neurologist); AND
4. Member has a diagnosis of DMD with a confirmed mutation between exons 18 to 58 in the DMD gene (genetic testing results required); AND
5. Member is ambulatory; AND
6. Member has an anti-AAVrh74 total binding antibody level <1:400 confirmed by ELISA; AND
7. Member meets **BOTH** of the following:
 - a) Has been stable on a corticosteroid for at least 12 weeks prior to starting therapy with Elevidys;
 - b) Will continue corticosteroid use for at least 60 days after therapy with Elevidys; AND
8. Documentation of baseline liver function, platelet count and troponin-I is included in chart notes; AND
9. Medication is not being used with exon skipping therapy (ex. Exondys 51, Vyondys 53, Amondys 45); AND
10. Member's weight is provided for dose calculation; AND
11. Member does not have **ANY** of the following:
 - a) Deletion in the exon 8 and/or exon 9 of the DMD gene;
 - b) Prior use of gene therapy.
12. **Dosage allowed/Quantity limit:** 1.33 x10¹⁴ vector genomes (vg)/kg given intravenously.

If all the above requirements are met, the medication will be approved for 3 months.

For **reauthorization**:

1. Elevidys is a one-time single infusion and will not be reauthorized.

CareSource considers Elevidys (delandistrogene moxeparvec-rokl) not medically necessary for the treatment of conditions that are not listed in this document. For any other indication, please refer to the Off-Label policy.

DATE	ACTION/DESCRIPTION
07/18/2023	New policy for Elevidys created.
