| Policy Type | | | |
| MEDICAL | | | |

Medical Policy Statements are derived from literature based on and supported by clinical guidelines, nationally recognized utilization and technology assessment guidelines, other medical management industry standards, and published MCO clinical policy guidelines. Medically necessary services include, but are not limited to, those health care services or supplies that are proper and necessary for the diagnosis or treatment of disease, illness, or injury and without which the patient can be expected to suffer prolonged, increased, or new morbidity, impairment of function, dysfunction of a body organ or part, or significant pain and discomfort. These services meet the standards of good medical practice in the local area, are the lowest cost alternative, and are not provided mainly for the convenience of the member or provider. Medically necessary services also include those services defined in any Evidence of Coverage or Certificate of Coverage documents, Medical Policy Statements, Provider Manuals, Member Handbooks, and/or other plan policies and procedures.

Medical Policy Statements do not ensure an authorization or payment of services. Please refer to the plan contract (often referred to as the Evidence of Coverage or Certificate of Coverage) for the service(s) referenced in the Medical Policy Statement. Except as otherwise required by law, if there is a conflict between the Medical Policy Statement and the plan contract, then the plan contract will be the controlling document used to make the determination.

According to the rules of Mental Health Parity Addiction Equity Act (MHPAEA), coverage for the diagnosis and treatment of a behavioral health disorder will not be subject to any limitations that are less favorable than the limitations that apply to medical conditions as covered under this policy.

A. Subject

Breast Reduction Surgery

B. Background

Women diagnosed with macromastia (excessively large breasts) seeking breast reduction typically present with complaints of a feeling of heaviness, chronic pain, and tension in the neck, shoulders, and upper back. Macromastia commonly causes permanent grooving and ulceration of the shoulder following years of wearing support bras to try to minimize symptoms. The physical and psychological symptoms of macromastia can significantly and negatively impact an individual's life and should be taken into consideration when evaluating surgical intervention.

Reduction mammaplasty is a surgical procedure that reduces the weight and volume of the breast. As much as 1 to 5 pounds of excess breast tissue is routinely removed during a reduction mammaplasty depending on breast and body mass. Indications for surgery include chronic pain and skin symptoms, neuropathy, breast discomfort, physical impairment, and psychological symptoms that can be associated with poor self-esteem and loss of desire to engage in activities.

Gynecomastia is a benign proliferation of glandular tissue of the breast in males. This condition may be caused by androgen deficiency, congenital disorders, medications, chronic medical conditions, tumors, or endocrine disorders. Depending on the cause of the tissue proliferation, surgical removal may be considered cosmetic or medically necessary.

C. Definitions

- Body Surface Area (BSA) A metric used for physiologic measurements, pharmacologic dosing, and therapeutic calculations, including the Schnur Sliding Scale for breast reduction surgery.
- **Cosmetic Procedures** Procedures performed for aesthetic purposes that do not improve or restore physiologic function.
- Functional/Physical or Physiological Impairment Impairment causes deviation
 from the normal function of a tissue or organ. This results in a significantly limited,
 impaired or delayed capacity to move and coordinate actions or perform physical
 activities and is exhibited by difficulties in physical and motor tasks, independent
 movement, or performing basic life functions.
- Gynecomastia Enlargement of the male breast secondary to a proliferation of ductal, stromal, and/or fatty tissue.
- Gynecomastia Scale A qualitative classification system for gynecomastia developed by the American Society of Plastic Surgeons (ASPS).
 - Grade I Small breast enlargement with localized button of tissue that is concentrated around the areola.
 - Grade II Moderate breast enlargement exceeding areola boundaries with edges that are indistinct from the chest.

- Grade III Moderate breast enlargement exceeding areola boundaries with edges that are distinct from the chest with skin redundancy present.
- Grade IV Marked breast enlargement with skin redundancy and feminization of the breast.
- Intertriginous Rash Dermatitis occurring between juxtaposed folds of skin, caused by retention of moisture and warmth and providing an environment favoring overgrowth of normal skin micro-organisms.
- Kyphosis Over-curvature of the thoracic vertebrae (upper back) associated with degenerative diseases, such as arthritis, developmental problems, or with osteoporotic compression fractures of vertebral bodies.
- Macromastia (Breast Hypertrophy) An increase in the volume and weight of breast tissue relative to the general body habitus.
- Symptomatic Breast Hypertrophy A syndrome of persistent neck and shoulder pain, shoulder grooving from brassiere straps, chronic intertriginous rash of the inframammary fold and/or frequent episodes of headache, backache, and upper extremity neuropathies caused by an increase in the volume and weight of breast tissue beyond normal proportions.
- Schnur Sliding Scale Used in calculating the amount of breast tissue to be removed in reduction mammoplasty (Appendix A).

D. Policy

- I. Common Ground Healthcare Cooperative (CGHC) considers breast reduction surgery for macromastia medically necessary when ALL the following criteria are met and have been documented:
 - A. Member is 18 years or older, or under 18 years with evidence that breasts have finished growing for a minimum of 1 year. Parental/guardian consent is required for members under age 18.
 - B. Breast size interferes with activities of daily living, as indicated by 1 or more of the following:
 - 1. arm numbness consistent with brachial plexus compression syndrome
 - 2. cervical pain
 - 3. chronic breast pain
 - 4. headaches
 - 5. nipple position greater than 21 cm below suprasternal notch
 - 6. persistent redness and erythema (intertrigo) below breasts
 - 7. restriction of physical activity
 - 8. severe bra strap grooving or ulceration of shoulder
 - 9. shoulder pain
 - 10. thoracic kyphosis
 - 11. upper or lower back pain
 - C. Preoperative evaluation by surgeon concludes that amount of breast tissue to be removed (by mass or volume) will provide a reasonable expectation of symptomatic relief.
 - D. No evidence of breast cancer

- 1. physical exam completed by a physician within the last year if under 40 years of age
- women 40 to 54 years of age or older with mammogram negative for cancer performed within the year prior to the date of the planned breast reduction surgery
- 3. women 55 years of age and older with negative mammograms for cancer every 2 years
- 4. women with family history of breast cancer with mammograms starting at least 7 years prior to when the youngest family member was diagnosed with breast cancer (as early as 30 years old)
- II. Breast reduction surgery following mastectomy to achieve symmetry is covered as part of the Women's Health and Cancer Rights Act (WHCRA). Please refer to the CGHC medical policy title *Breast Reconstruction Surgery* for additional information.
- III. CareSource considers breast reduction surgery for gynecomastia medically necessary when ALL the following clinical criteria are met and have been documented:
 - A. Member is 18 years or older, or under 18 years with evidence that breasts have finished growing for a minimum of one year. Parental/guardian consent is required for members under age 18.
 - B. A physical exam has been conducted by an appropriately credentialed provider and confirms the presence of gynecomastia:
 - 1. pubertal male (adolescent)
 - a. gynecomastia present for more than 1 year after pathological causes ruled out
 - b. Gynecomastia Grade II, III, or IV
 - 2. postpubertal male
 - a. gynecomastia present for more than 3 months after pathological causes ruled out
 - b. Gynecomastia Grade III or IV
 - C. The tissue being removed is glandular breast tissue and not the result of obesity, adolescence, or reversible effects of drug treatment that can be discontinued.
 - D. The gynecomastia is attributed to an underlying condition (not an all-inclusive list), including:
 - 1. androgen deficiency
 - 2. chronic liver disease that causes decreased androgen availability
 - 3. Klinefelter syndrome
 - 4. adrenal tumors that cause androgen deficiency or increased secretion of estrogen
 - 5. brain tumors that cause androgen deficiency
 - 6. testicular tumors that cause androgen deficiency or tumor secretion of estrogen
 - 7. endocrine disorders (eg, hyperthyroidism)

- E. The gynecomastia causes functional impairment (eg, pain, chronic irritation) and breast reduction surgery is not for cosmetic reasons.
- F. Breast malignancy was ruled out.

IV. Schnur Sliding Scale

The Schnur Sliding Scale is one of several evaluation tools used to determine the appropriate volume of tissue to be removed relative to a member's total body surface area (BSA). This estimation can be instrumental in determining whether breast reduction surgery is being planned for cosmetic reasons or as a medically necessary procedure.

- A. The weight of tissue to be removed from each breast is recommended to be above the 22nd percentile on the Schnur Sliding Scale (Appendix A below) based on the member's BSA.
- B. The BSA in meters squared (m²) is calculated using the Mosteller formula (square root of the result of height (inches) multiplied by weight (lbs) and divided by 3131).

Appendix A: Schnur Sliding Scale

| Body Surface Area and Minimum Requirement for Breast Tissue Removal | | |
|---|---|--|
| Body Surface Area (m²) | Grams per Breast of Minimum Breast Tissue to be Removed | |
| 1.350-1.374 | 199 | |
| 1.375-1.399 | 208 | |
| 1.400-1.424 | 218 | |
