A. SUBJECT
Breast Reconstruction Surgery Following Mastectomy
For the purpose of this policy “mastectomy” includes “simple”, “radical”, “modified radical” and medically necessary breast conserving procedures.

B. BACKGROUND
Breast conserving surgery and mastectomy are mainstays in the primary treatment of breast carcinoma. These procedures, although effective, are associated with post-operative complications, physical deformity, emotional and psychological sequelae.

Reconstructive surgery refers to surgical procedures and other techniques, undertaken in the context of breast cancer, to rebuild breast contour and, when necessary, reconstitute the areola and nipple.

Legislation, including the Women’s Health & Cancer Rights Act of 1998 (WHCRA) has been enacted to include protections for members who choose to have breast reconstructive procedures following mastectomy. Benefits under this legislation include:

- Reconstruction of the breast on which the mastectomy was performed
- Surgery and reconstruction of the other breast to produce a symmetrical appearance
- Prostheses and physical complications at all stages of mastectomy, including lymphedemas

The role of reconstructive surgery has evolved considerably since the 1980’s. Today, clinical decision making must incorporate the timing of the procedure; the impact and role of adjuvant chemotherapy and/or radiation therapy; the utilization of clinically established prosthetic devices and an array of autogenous procedures.
C. POLICY

1. CareSource considers reconstructive breast surgery medically necessary with mastectomy in the following circumstances:
   a. Mastectomy with significant deformity and physical functional impairment where the reconstructive procedure can reasonably be expected to improve the deformity and impairment.
   b. Associated nipple and areolar reconstruction or tattooing of the nipple when required as part of reconstructive procedures may also be considered medically necessary.
   c. Reduction and, if needed, augmentation mammoplasty and related reconstructive procedures on the unaffected side for symmetry may also be considered medically necessary.
   d. Liposuction and/or lipectomy of autologous fat for harvest and grafting as a replacement for implants in reconstructive surgery may also be considered medically necessary.

2. CareSource considers all other conditions for breast reconstructive surgery as cosmetic and not medically necessary.

3. CareSource considers treatment of lymphedema following mastectomy, including the use of lymphedema pumps and compression sleeves, to be medically necessary when supported by appropriate clinical records. Complete Decongestive Therapy may be considered medically necessary when it is prescribed by, or is provided under the supervision of a provider and is accompanied by documentation of failure of other standard therapies for lymphedema (including home exercises, elevation of the limb and appropriate compressive garments).
